

## **ADSL Microfilter – EM1100R**

With the EM1100R is an in-line microfilter designed for use between an existing PSTN or POTS (Plain Old Telephone Service) device such as phone extensions, fax machines and telephone answering machines, and the telephone line. The microfilter allows these devices to function normally e.g. for normal voice telephone calls over a telephone line used for the ADSL service.

The EM1100R in-line microfilter must be mounted between each telephone device and the telephone line.

Each ADSL modem ordered through PCUG has included in the box one microfilter. To order additional EM1100R in-line microfilters please fill in the number “EM1100R” in the “Netcomm ADSL Device” box at the bottom right of the ADS: Application Form.
