

ADSL POTS Splitter Box – EM1180

With the EM1180 ADSL POTS (Plain Old Telephone Service) Splitter Box a single telephone line may be used for both normal voice telephone calls and the ADSL service.

The EM1180 ADSL Splitter Box must be mounted on the incoming line, and all other telephone devices connected after it. The EM1790 will allow the use of one telephone line simultaneously for normal Voice use of the telephone and ADSL services. The EM1180 minimises Voice Band Interference and eliminates the need for additional micro filters on each analog phone device such as phone extensions, fax machines and telephone answering machines, as well as allowing the security service to operate.

To order an EM1180 ADSL POTS Splitter Box please fill in the number “EM1180” in the “Netcomm ADSL Device” box at the bottom right of the ADSL Application Form.
